

## Design & Technology

# Project Management in Design and Manufacturing (4.3c)

### Materials required for questions

---

- Pencil
- Rubber
- Calculator

### Instructions

---

- Use black ink or ball-point pen
- Try answer all questions
- Use the space provided to answer questions
- Calculators can be used if necessary
- For the multiple choice questions, circle your answer

### Advice

---

- Marks for each question are in brackets
- Read each question fully
- Try to answer every question
- Don't spend too much time on one question

## Good luck!

**Q1.** What is a key advantage of Critical Path Analysis?

- A** Shows which activities can be delayed without affecting project completion time
- B** Eliminates all project risks automatically
- C** Reduces the need for project planning

**Q2.** How does Scrum achieve flexible, holistic product development?

- A** Through rigid planning at the start with no changes allowed
- B** Through iterative sprints with continuous feedback and adaptation
- C** By following a strict waterfall approach

**Q3.** What is a disadvantage of Scrum?

- A** It only works for software projects
- B** Difficult to implement in projects with fixed regulatory requirements
- C** Requires teams of exactly 7 members

**Q4.** What is the primary purpose of Six Sigma?

- A** To increase project timelines for better quality
- B** To improve output quality by identifying and removing causes of defects
- C** To organise work into two-week sprints

**Q5. Outline the process of critical path analysis (4 marks)**

---

---

---

---

---

---

---

**Q6. Explain two ways Six Sigma can improve manufacturing processes (6 marks)**

1.

---

---

---

---

2.

---

---

---

---

---

---

**Q7.** Give **three** features of critical path analysis **(3 marks)**

---

---

---

---

---

---

---

**Q8.** Six Sigma is used in manufacturing to identify and remove the causes of defects. Reducing costs is one of the five value targets used in Six Sigma. Give **two** other value targets used in Six Sigma. **(2 marks)**

---

---

---

---

---

---

---

**Q9a.** Give the three roles within the scrum team. **(3 marks)**

---

---

---

## Answers

Q1. A

Q2. B

Q3. B

Q4. B

Q5.

- Compile a list of all activities/work breakdown structure (1)
- Work out the length of time/duration required for each activity (1)
- Determine the relationships/links between the activities (1)
- Determine specific points of time in the process/milestones/deliverable items (1).

Q6.

- Six Sigma improves quality of products by focusing on quality control (1) aimed at reducing the number of defects (1) from the 1st Sigma at 30% defects to the 6th Sigma at less than 0.001% defects (1)
- Six Sigma reduces the process cycle time (1) by removing errors / unnecessary stages in production (1) for example reducing the number of products that need to be reworked or replaced / inefficient layout of production lines / paperwork being completed that is not needed (1)
- Six Sigma reduces pollution resulting from the process (1) by reducing transportation and travel (1) and reducing production of waste due to product faults / utilising more energy efficient processes (1)
- Six Sigma reduces costs (1) by simplifying processes and steps needed / by using common manufacturing processes for different products (1) therefore reducing setting up time / reducing the amount of capital investment needed (1)
- Six Sigma makes processes as consistent as possible (1) by streamlining processes (1) which reduces the possibilities for defects (1)
- Six sigma improves efficiency / productivity (1) by using DMAIC (Define, Measure, Analyse, Improve, Control) (1) resulting in improved / streamlined use of resources (1)
- Six Sigma is a management tool / methodology (1) where employees become involved in the implementation of quality improvement (1) helps with defect reduction as employees understand the processes involved in the manufacturing of the product (1)

**Q7.**

- Projects broken down into small 'step by step' stages (1)
- Stage timings/duration shown (1)
- Route of stage completion to subsequent stage starts (1)
- Shows dependencies between activities (1)
- Indication of routes to completion (from shortest to longest) /optimum route to completion (1)
- Concurrent less critical activities (1)
- Identification of activities with most impact on overall completion (1)
- Identification of 'float' (1)
- Key dates or timings (1)
- Links to JIT (1)
- Reduces downtime (1)

**Q8.**

- Reduce process cycle time / improve speed of production (1)
- Reduce pollution / waste (1)
- Increase customer satisfaction / meet user requirements (1)
- Increase profits (1)

**Q9a.**

- Product owner (1)
- Scrum master / project leader / project manager (1)
- Developers / development team / designers (1)

**Q9b.**

- Holistic project management strategy (1)
- Teamwork is at the centre of the process (1)
- Control over the empirical process (transparency, evaluation and adaptation) (1)
- Self-organisation (increases the level of independence of the team) / feedback from workers / daily team meetings / scrum sessions (1)
- Assessment of team performance (1)
- Team goals (1)
- Led by scrum master / leader / project manager (1)
- Collaboration (awareness, clarity and distribution) (1)
- Feedback at every stage (1)

- Value based prioritisation (value and importance to end users and the manufacturer to determine order of completion) (1)
- Timeboxing (allocating and scheduling time to activities) (1)
- Sprints (short release cycles with planning, daily monitoring and reviews) to achieve smaller broken down tasks (1)
- Iterative development (constant/ongoing adjustment and revision of design to create the best product possible) continuous improvement (1)
- Scrum values: commitment, courage, focus, openness and respect (1)
- Consumer feedback to update designs (1)
